

Tbx2b IS REQUIRED FOR PARAPINEAL ORGANOGENESIS

By

Corey Deanne Snelson

Dissertation

Submitted to the Faculty of the
Graduate School of Vanderbilt University
in partial fulfillment of the requirements

for the degree of

DOCTOR OF PHILOSOPHY

in

Biological Sciences

May, 2009

Nashville, Tennessee

Approved:

Professor Lilianna Solnica-Krezel, Ph.D

Professor Christopher V.E. Wright, D. Phil

Professor Laurence Zwiebel, Ph.D

Professor Jasson R. Jessen, Ph.D

Professor Joshua T. Gamse, Ph.D

To my parents, Jackie and Gerry,
the most wonderful parents a girl could ever have.

ACKNOWLEDGEMENTS

First and foremost, I would like to thank all of the members of my committee, Dr. Jason Jessen and Dr. Larry Zwiebel, for their invaluable words of advice. In particular Dr. Lila Solnica-Krezel, Dr. Bruce Appel, and Dr. Chris Wright have taught me how to think like a developmental biologist, and treated me as a peer. Additionally, the work presented in Chapter IV of this work would not have been possible without the generous contributions of Dr. Ethan Scott and Lindsay Mason of Dr. Herwig Baier's laboratory. Finally, the work presented in this thesis is supported by a Whitehall Foundation Grant or NIH/NICHD grant.

The people that I work with in the Gamse Laboratory have made my life so much easier, and have without a doubt made lab work fun. I couldn't have asked for a better group of co-workers, and know that they have made the completion of my PhD possible: Robert Taylor who is the coolest person I know, Caleb Doll for his constant hollering that I love so much, Josh Clanton for his steady composure, Erin Booton, Nancy Hernandez de Borsetti, Anna Talaga, Kyle Hope and Tim Hegeman, my first and favorite undergrad: "haaaayyyyy....."

I have had the great fortune of making many, many friends while at Vanderbilt. In particular I have shared very many laughs with Jennifer Ellis, Sabata Lund, Eric Janson, Susanne Tranguch, Nikki Shariat, Alex and Erin Flynt, Jason and Rachel Aleksander, Nyk Reed, Drew Latimer, and Dan Carlin, my surrogate brother and antagonist, as well as many, many others too numerous to name here. I have to give special thanks to my first and best friend in Nashville,

Patricia Russell, who introduced me to the finest things in life: backpacking, Jarlsberg cheese, and Bill Bryson. I will always have a special place in my heart for anyone who can put up with me long enough to go out in the woods for days at a time on backpacking trips, in particular, Josh Clanton, Robert and Katie Taylor, Jason Aleksander, Dominique Donato, and my most reliable backpacking partner and friend, Drew Latimer.

I am particularly blessed to have found Josh, my advisor, teacher, and friend. I will always be incredibly grateful to Josh for taking a chance on me. When I came to Josh's lab as the first graduate student, my scientific confidence had been completely destroyed by events that had occurred during previous graduate school experience. Josh spent a lot of time repairing that damage and wordlessly convinced me that I could be a good scientist. I hear horror stories from other students about their graduate experience, and all I can think is I am so, so, so lucky to have found Josh. THANK YOU SO MUCH!!!! I can never repay you for everything you've done for me.

Finally, my parents, who are the two most wonderful people to ever walk on the face of this planet. They love me unconditionally, and have always been there for me emotionally and FINANCIALLY! I would not be being truthful if I said that my father's career did not influence my own career choices. He is a true Renaissance man, and his curiosity about EVERYTHING is a true inspiration. I am especially close to my Mom, the Supernurse, who supports me no matter what, and has taught me so much about life, the world, and keeps me in the loop with crazy stories of her Appalachian patients. I love you!!!

TABLE OF CONTENTS

	Page
DEDICATION.....	ii
ACKNOWLEDGEMENTS.....	iii
LIST OF TABLES.....	viii
LIST OF FIGURES	ix
Chapter	
I. INTRODUCTION	1
Nervous System Asymmetry.....	1
Anatomical asymmetry of the zebrafish epithalamus	7
Epithalamic asymmetry is a conserved feature of many vertebrates	9
Function of the epithalamus	11
Development of the epithalamus.....	12
Nodal signaling dictates the direction of brain asymmetry in zebrafish.....	15
Specification and migration of the parapineal organ	17
Laterality of the parapineal organ and habenular nuclei is coordinated in zebrafish	21
Conserved habenulo-interpeduncular projections are dependent on the presence of the parapineal organ.....	22
Discussion.....	23
II. Tbx2b IS REQUIRED FOR THE DEVELOPMENT OF THE PARAPINEAL ORGAN.....	25
Abstract.....	25
Introduction	26
Materials and Methods.....	29
Zebrafish	29
Mutagenesis and Screening.....	29
Cloning of <i>fbby</i>	30
Genotyping <i>fbby</i> mutants.....	30
Morpholino injections.....	31
RNA in situ hybridization	31
Immunofluorescence.....	32

Time-lapse imaging	33
Cell ablation.....	34
Results	35
The <i>from beyond</i> mutation abolishes habenular asymmetry	34
<i>fb</i> y mutants have fewer and mispositioned parapineal cells.....	41
The <i>fb</i> y mutation introduces a premature stop codon in the <i>tbx2b</i> coding sequence.....	52
<i>tbx2b</i> is expressed early in the pineal complex anlage.....	54
Migration of parapineal cells is disrupted in <i>fb</i> y mutants	59
Discussion.....	64
Expression of <i>tbx2b</i> in the pineal complex specifies parapineal.....	64
<i>tbx2b</i> specifies parapineal cells without affecting Nodal signaling.....	66
Parapineal cells require <i>tbx2b</i> activity to migrate away from the pineal complex anlage.....	66
An evolutionarily conserved role for Tbx genes in parapineal formation?	68
III. FORMATION OF THE ASYMMETRIC PINEAL COMPLEX IN ZEBRAFISH REQUIRES TWO INDEPENDENTLY ACTING TRANSCRIPTION FACTORS	70
Abstract.....	70
Introduction	71
Materials and Methods.....	73
Zebrafish	73
RNA in situ hybridization	73
BrdU labeling.....	74
Time-lapse imaging	74
Immunofluorescence.....	74
Results.....	75
Parapineal cell division ends prior to pineal cell division	75
The parapineal organ in <i>flh</i> mutants develops similarly to WT.....	80
Flh and Tbx2b do not regulate one another's expression.....	86
<i>flh</i> ; <i>fb</i> y double mutants have an additive phenotype.....	89
Discussion.....	91
IV. PARAPINEAL CELLS ARISE FROM DISCRETE LOCATIONS WITHIN THE PINEAL COMPLEX ANLAGE	94
Abstract.....	94
Introduction	95
Materials and Methods.....	99

Zebrafish	99
Photoconversion.....	99
Time-lapse imaging	99
RNA in situ hybridization	100
Results.....	101
Parapineal cells express the transgene <i>GAL4VP16</i> ^{s1145t} at the appropriate time and place	101
Parapineal cells migrate from the left and right sides of the pineal complex anlage.....	103
Parapineal cells arise from discrete locations with in the pineal complex anlage.....	108
<i>tbx2b</i> transcripts exhibit the same pattern in both <i>fbv</i> and <i>lor</i> mutant embryos.....	111
The pineal complex phenotype of <i>lor</i> is morphologically similar but not identical to <i>fbv</i>	115
Discussion.....	118
Early fate mapping may distinguish between two models of parapineal cell development.....	118
How does Nodal signaling affect the behavior of parapineal cells?.....	120
Characterization of the <i>lor</i> mutant identifies a second hypomorphic allele of <i>tbx2b</i>	121
V. CONCLUSIONS AND FUTURE DIRECTIONS	123
Future Directions.....	127
What genes are responsible for parapineal organ migration?.....	127
How does <i>tbx2b</i> affect specification of the parapineal organ?.....	128
How has the fate of the parapineal cells in <i>fbv</i> been changed?.....	133
Do parapineal cells follow a leader cell during migration?	134
How does the mutation in <i>tbx2b</i> affect pineal organ development?	135
Models of Parapineal Specification and Migration.....	136
Concluding Remarks.....	142
REFERENCES	144

LIST OF TABLES

Table	Page
1. Number of labeled cells present in the pineal complex of fby mutants.....	44
2. Fate of pineal complex cells labeled with BrdU between 10 s and 30 hpf	79
3. Number of labeled cells present in the pineal complex of single and double mutants.....	85

LIST OF FIGURES

Figure	Page
1. Schematic representation of the 4 dpf larval zebrafish epithalamus	6
2. Schematic representation of pineal complex development from somitogenesis through embryogenesis	19
3. The left and right habenulae develop more symmetrically in <i>from beyond (fby)</i> mutants.....	38
4. Asymmetric expression of Nodal pathway components was unaffected by the <i>fby</i> mutation.....	40
5. Disruption of parapineal formation in <i>fby</i> mutant larvae	42
6. Fewer and misplaced parapineal cells in <i>fby</i> mutants.....	47
7. The <i>fby</i> mutation has ectopically placed GFP+ cells.....	48
8. Reduced numbers of WT parapineal cells are able to migrate.....	51
9. The <i>fby</i> mutation is a premature stop codon in the <i>tbx2b</i> gene.....	53
10. <i>tbx2b</i> expression in the pineal complex	56
11. The planar cell polarity pathway is not disrupted in <i>fby</i> mutant embryos.....	59
12. Parapineal cells do not migrate to the left side of the brain in <i>fby</i> mutants.....	63
13. Cell division of parapineal precursors is largely complete by 18 s	78
14. Parapineal cells migrate asymmetrically in <i>flh</i> mutants.....	80
15. In <i>flh</i> mutants, parapineal specification is normal, but the pineal organ is reduced in size.....	84
16. <i>Flh</i> and <i>Tbx2b</i> do not regulate one another's expression	88
17. Double homozygous <i>flh; fby</i> mutants exhibit an additive phenotype.....	90

18. Parapineal cells express Kaede at 24 hpf in Tg(<i>cfos:gal4VP16</i>) ^{s1145t}	102
19. Photoconversion of the anterior region of the pineal complex anlage at 24 hpf highlights parapineal cells.....	104
20. Parapineal cells exhibit dynamic movement through migration from the right side of the pineal complex anlage	107
21. Parapineal cells arise from discrete locations within the pineal complex anlage	110
22. Expression of <i>tbx2b</i> is reduced in <i>fbx^{-/-}</i> ; <i>lor^{-/-}</i> ; and <i>fbx;lor</i> <i>transheterozygotes</i> at 24 hpf as compared to wild type	114
23. The <i>lor</i> hypomorphic mutation in <i>tbx2b</i> phenocopies the <i>fbx</i> mutation.....	117
24. Models of parapineal cell formation	141
25. Model of pineal complex development.....	143
